were conducted to validate the static model process (Chapter 9). History-matched simulations served to ground truth the model at the well to multi-well scale, which was critical to building confidence in the modeling process and the static model as an accurate model of lithofacies, petrophysical properties, water saturation, and gas in place.

Chapter 2 Static Models Object Attributes and Invariants Models can be divided into static, dynamic, and interactive parts dealing with, respectively, what is known about an object at any one moment, how this information changes dynamically with events, and how objects interact with one another.

Static modeling is used to specify the structure of the objects that exist in the problem statement. These can be expressed using: CLASS, OBJECT and USECASE diagrams. Dynamic modeling refers to represent the object interactions during runtime.

Static vs Dynamic Modelling . Any system can be described using a mathematical model that contains mathematical symbols and concepts. Mathematical modeling is the name of the process that is undertaken to develop a model for a particular system.

complexity of a model iteratively. An important issue in modeling is model validity. Model validation techniques include simulating the model under known input conditions and comparing model output with system output. Generally, a model intended for a simulation study is a mathematical model developed with the help of simulation software.
