Abstract: The purpose of the course is to develop several methods that have been used over the years to deal with non-perturbative physics in quantum field theory. Such methods are rarely taught in today's graduate programs. Such methods complement modern approaches to non-perturbative physics using the holographic correspondence. There are two parts.

### Non-perturbative Quantum Field Theory

Non-perturbative Methods in Quantum Field Theories by Peter Mati The non-perturbative aspects of quantum field theories (QFT) seem to be indispensable to understand the qualitative behaviour of strongly interacting physical systems. In my thesis we are going to discuss two different non-perturbative approaches. One of them is the

Riemannian manifold  $M_0 = \{\tilde{t}^i\}$  with metric  $g_{ij}$  since an arbitrary non-singular field redefinition  $\tilde{t}^i \rightarrow \tilde{t}'^i$  transforms  $g_{ij}$  in the same way as a metric transforms under a change of coordinates. If  $V = 0$

identically, then  $M_0$  would describe a manifold of vacua of this theory. We call such a manifold of vacua the moduli space of the theory.

### **Non-Perturbative Dynamics Of Four-Dimensional**

While the perturbative (in the coupling constant) predictions of Quantum Chromodynamics (QCD) agree well with experiment, there is a large class of experimental quantities where perturbation theory cannot be applied. To test QCD in such circumstances, other methods must be used in order to extract predictions from the theory.

### **NON-PERTURBATIVE METHODS: HQET AND LATTICE GAUGE THEORY**

agogical and up-to-date exposition of non-perturbative methods in relativistic quantum field theory and introduces the reader to modern research work in theoretical physics. It describes in detail non-perturbative methods in quantum field theory, and explores two-dimensional and four-dimensional gauge dynamics using those methods.
