Observations on determinization of Büchi automata Christoph Schulte Althoff, Wolfgang Thomas, Nico Wallmeier — RWTH Aachen, Lehrstuhl Informatik 7, 52056 Aachen, Germany Abstract The two determinization procedures of Safra and Muller's Schupp for Büchi automata are compared, based on an implementation in a program called OmegaDet.

In taking a piece the automaton makes the same motions of the arm and hand to lay hold of the piece, which it conveys from the board ; and then returning to its own piece, it takes it up, and places it on the vacant square.

deterministic Rabin automaton, given a Büchi automaton with  $n$  states ([4], [5]). Safra [6] was the first to find a construction which matches this lower bound. It seems now the standard way of showing Büchi automata determinization.

Dear Internet Archive Supporter, I ask only once a year: please help the Internet Archive today. The average donation is \$45. If everyone chips in \$5, we can end this fundraiser today. Right now, your donation will be matched, doubling your impact! All we need is the price of a paperback book to sustain a library the whole world trusts.

Diagnosis by Observation Automaton MOD is an automaton that models the system (all the states are initial) OBS is the observation automaton the diagnosis automaton is defined by MOD  $\hat{=}$  OBS When the diagnosis automaton is computed, the diagnosis can be easily retrieved

automata) and the diagnosis formally defined as the synchronized composition of the model with the observations. A problem that can be encountered is the size of the observation automaton, due to the temporal uncertainties on the observations or/and the duration of the observation recording. For instance, we may want to compute an a posteriori
